Example 10; Page 64; 98pp; English.

The invention relates to a pharmaceutical composition for treating a clisease associated with one or more self-molecules present non-physiologically in an individual (e.g., autoimmune diseases), comprising an immune modulatory nucleic acid (INS, immune modulatory sequence) comprising a hexamer region of the formula 5'-purine-pyrimidine-[X]-[Y]-pyrimidine-pyrimidine-iv, where X and Y are any naturally-occurring or synthetic nucleotides except cytosine-guanine, and a pharmaceutical carrier. The immune modulatory nucleic acid may also contain a polyg cregion linked 5' and/or 3' to the hexamer region. The invention also relates to a nucleic acid composition comprising a nucleic acid vector creates to a nucleic acid composition comprising a nucleic acid vector having at least one cytosine to non-cytosine substitution (preferably C to G) within a CpG motif, wherin the CpG motif is of the formula: (a) 5'-purine-pyrimidine-jyrimidine-jyrimidine-3'; or (b) 5'-purine-purine-CC -pyrimidine-pyrimidine-3'; or (b) 5'-purine-purine-CC -generally in the treatment of disease associated with one or more self-conceines present non-physiologically in an individual, such as contained acid care and a proper contained acid sequences and accounts of the purine-purine disease associated with one or more self-contained acid care and accounts of the contained acid sequences are useful in the treatment of disease associated with one or more self-contained acid care acid sequences. autoimmune diseases (e.g., multiple sclerosis, rheumatoid arthritis, insulin-dependent diabetes mellitus, autoimmune uveitis, primary biliary

                                                                                                                                                                                                          This invention relates to a novel active oxygen stress-responsive promoter that effectively induces target gene expression during active oxygen stress under stringent conditions. Specifically, it refers to transforming a plant with a vector containing a promoter that is operably linked to a target gene, and furthermore controls target gene expression in the leaf base, leaf and stalk or root of the plant. The present invention describes inducing expression of one of the following tobacco genes namely NTPXC1, NTPXC2 or NTPXC3 during active oxygen stress conditions in a given transformed plant cell, such as Agrobacterium tumefaciens or Arabidopsis thallana. This oligonucleotide is a PCR primer used to isolate and amplify the tobacco NTPXC1 active oxygen stress-responsive promoter DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  scleroderma, pernicious anaemia, systemic lupus erythematosus, ankylosing spondylitis, autoimmune skin diseases and Grave's disease); inflammatory diseases (e.g., osteoarthritis, gout, pseudogout, hydroxyapatite deposition disease, asthma, bursitis, tendonitis, conjunctivitis, urethritis, cystitis, balanitis and dermatitis); or other conditions such as spinal cord injury, peptic ulcer, hyperlipidaemia, coronary artery disease and migraine. The present sequence represents a specific example of an immune modulatory nucleic acid predicted to be useful for modulating autoimmune disease which is referred to in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel active oxygen stress-responsive promoter, useful for regulating expression of target gene under active oxygen stress conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-JUL-2004

                                                                                                                                                              The oligonucleotides AAT03687-9 are examples of probes used in a novel DNA purification method designated triplex-affinity capture. The method comprises binding an oligonucleotide probe to a double-stranded target nucleic acid under conditions where a triple helix is formed. The probe is attached directly or indirectly to the one half of a specific binding pair e.g. biotin/avidin, antigen/antibody. The other half of the binding capair is attached to an immobiliaing agent e.g. a bead. After formation of the target-probe-binding pair-solid support complex, the target mol. can be recovered by separating the complex from the medium and separating the complex from the medium and separating the corpobe from the target nucleic acid. The method can be used to isolate very large specific intact double strand DNA from a heterogenous mix. This primer was used to assay for transformants separated by the method contains a 45 bp simple T-C repeat which is able to form a triple helix with a (T-C)-contg. probe e.g. AAT03689

                                                                                                                                                                                                                                                                                         吊
                                                                                                                                                                                                                                                                                                               The invention relates to an improved method (M) for preparing nucleic CC acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) con a solid support phase using monomer or oligomer units, where the units; (C) is treating the support with a solution of an alkylamine in an inert solvent; (C) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at CC least one synthetic address unit (SAU) attached to a support material (C) comprising an array of discrete locations, where the same SAU is attached to at least two predetermined locations on the support material, and at CC least two conjugates comprising synthetic binding unit (SBU) and a concludic acid (NA), where at least two of the conjugates have the same SBU CC and different NAs, where the SBU of the conjugates have the same SBU coations. The method is useful for preparing nucleic acid conjugates with Synthetic binding units. The method also enables efficient and specific sorting of relatively complex mixtures of nucleic acids to predetermined CC sorting on a support. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an improved method (M) for preparing nucleic CC acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) con a solid support phase using monomer or oligomer units, where the units (C) are beta-cyanoethyl-protected on at least one phosphorus of the units; (C) it treating support with a solution of an alkylamine in an inert solvent (C), and (C) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at CC least one synthetic address unit (SAU) attached to a support material (C) comprising an array of discrete locations, where the same SAU is attached to at least two predetermined locations on the support material, and at C least two conjugates comprising synthetic binding unit (SBU) and a culcic acid (NA) where at least two of the conjugates have the same SBU cand different NAs, where the SBU of the conjugates form a synthetic binding system unit (SBS) with the SAU at the two predetermined (C) locations, and immobilize each of the two different NAs at a different CC sorting of relatively complex mixtures of nucleic acid conjugates with synthetic binding units. The method also enables efficient and specific continuous of the support. This sequence represents an oligonucleotide used con the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an improved method (M) for preparing nucleic CC acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) con a solid support phase using monomer or oligomer units, where the units (CC are beta-cyanoethyl-protected on at least one phosphorus of the units; cC (b) treating support with a solution of an alkylamine in an inert solvent (C); and (c) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at (CC). The patent also claims a supermolecular construct (I) comprising at (CC) as the protect construct (I) comprising at (CC) are provided to a support material (CC) at least two predetermined locations on the support material, and at (CC) are provided to a conjugate comprising synthetic binding unit (SBU) and a (CC) and different NAs, where at least two of the conjugates have the same SBU (CC) and different NAs, where the SBU of the conjugates form a synthetic binding system unit (SBS) with the SAU at the two predetermined (CC) locations, and immobilize each of the two different NAs at a different (CC) sorting of relatively complex mixtures of nucleic acid conjugates with (CC) sorting of relatively complex mixtures of nucleic acids to predetermined (CC) locations on a support. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAC85321-40 and AAC85342-51 are primers which were used in the construction of baculovirus expression vectors for the expression of the fusion protein PARPIA/PARP2B. This protein contains amino acids 1-662 of hPARPI fused upstream of amino acids 230-583 of hPARP2. The fusion protein coding sequence is given in AAC85341. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neeplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, as, arthritis, encephalitis, myocardial ischemia, and leukocyte
                                                                                                                                                                                                                                                                                             Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 3; Page 79; 129pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2001-025335/03.

                                                                                                                                                                                                                                                                                                                                                 The present invention describes bases in the shape of a string, tape or circular disc on the surface of which a plural number of different ligands are immobilised respectively in pre-determined domains. Also described are devices for detecting the binding between the ligands and receptors and methods for detection using these bases. The methods are useful for detection in biochemical and diagnostic assays. The ligands are immobilised in line, so the user only needs to determine the presence or absence of receptor binding, without further processing. AAH41754 to AAH41815 represent primers which are used in an example from the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a substrate having a number of ligands which have been immobilised onto a predetermined region of its surface, in which the region on the substrate has such a shape as to allow the concentration of signals caused by binding of the ligands to receptors in the region toward the receiver. Also described is a substrate for the immobilisation of such ligands. The substrates are applicable in gene engineering for studying relationship between structures and biological activity e.g. effect of endocrine disrupters on various genes and also in investigating the effect of hormones, drugs and other chemicals on the environment. Such substrates are highly sensitive in detecting the ligand-receptor binding, with affinity and reproducibility. The ligand-immobilised substrates can be produced in high density e.g. in microarray form to provide finely tuned results. ADA00221 to ADA00282 represent PCR primers used for amplifying genes in the exemplification of the present revertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; genomic DNA; polymorphism; genome; allele-specific; primer; probe; hybridisation; polymorphic site; forensic; paternity testing; medicine; phenotypic trait; genetic analysis; genetic mapping; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allele specific oligonuclectide that hybridises to a segment of the novelty: (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid sequences for the presence of polymorphisms. The presence of the phenotype with a particular polymorphism. The presence of polymorphic sites are useful for, e.g. forensics, paternity testing, correlation of polymorphisms with phenotypic traits and for genetic tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The allelic ladder mixture comprises at least one of the following allelic ladders: (i) at least one allele for locus HUMVWFA31/A; (ii) one allele for locus HUMTHO1; (iii) at least one allele for locus BSS1179; (iv) at least one allele for locus HUMTHO1; (iv) at least one allele for locus BSS1. The allele for locus D21S11; and (vi) an allele for locus D28S1. The alleles or allelt ladders are useful in forensic tests for comparison with a sample DNA profile, when the profile is based on analysis of at least one loci of HUMVWFA31/A, HUMTHO1, D8S1179, HUMFIBRA/FGA, D21S11, D18S51 or ANG (amelogenin sex test). DNA profiling is useful in anthropological, paternity, maternity, crime detection and other forensic environments. The new allelic ladders have an improved range and coverage of DNA, and include a number of rare alleles which offers improved identification of an unknown sample
               The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vannemei (ABN80997-ABN81172), both containing microsatellites sequences including those p. monodon microsatellite sequences given in GenBank AF077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are useful
                                                                                                                                                                                                                                                     Polynucleotides of shi

Detection and characterisation of nucleic acid sequences - by mixing a folded target and one or more probes to form a probe/folded target complex and detecting and characterising the complexes.

Example 1; Page 111; 279pp; English.

The invention relates to methods and compositions of detection and CC characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing; (i) a folded target having a DNA sequence comprises: (a) providing; (i) a region and at least 1 single stranded comprising at least 1 double stranded complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe continuous formation of mixing the target complex. Also provided are methods for determination of caridat targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences of indicative of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the cancers are the paternity determinations. The methods allow simultaneous

The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences AAV70430-31 represent primers used for the PCR amplification of M. tuberculosis katG gene. This is used in the CFLP analysis of mutations in the katG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-JUN-2000;

The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primers that i amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Page 139; 409pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               conditions.

                                                                          The invention describes a method of analysing nucleic acids comprising providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR, a second oligonucleotide binding to a portion of the first NCSR and a cleavage gent, and mixing the contents to form a cleavage structure. The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents a primer used in the isolation of a Mycobacterium tuberculosis katG gene polynucleotide labelled with tetrachlorofluorescein (TET) used to demonstrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analyzing nucleic acids, comprises mixing target nucleic acid hepatitis C virus nucleic acid, bridging oligonucleotide, secon oligonucleotide and cleavage agent to form cleavage structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    non-contiguous single-stranded region; NCSR; c clinical; diagnostic; microorganism detection; microorganism identification; katG; target var
                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1;

                                                                                                                  AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                             Novel PRO polypeptides and polynucleotides used in detection methods, target bloactive molecules to specific cells, and to modulate cellula

The Ab can be used in compositions and methods for the diagnosis and treatment of neoplastic cell growth and proliferation in mammals, including humans. Genes and polypeptides encoded by them, that are amplified in the genome of a tumour cell, can be identified and are useful targets for the treatment and prevention of certain cancers and may be used to monitor tumour treatment. Compounds that inhibit the expression or activity of the identified polypeptides can be identified and used as antagonists. Benign or malignant tumours, inflammatory disorders and immunological disorders can be treated.

AAC58123 to AAC58224 represent hybridisation probes and PCR primers used in the isolation of the human PRO sequences. AAC58241 and AAB24041 to AAB24056 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                         is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequence, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or biotreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-JAN-2000

                                                                                                                                                                                        The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful in PRO polypeptide detection methods. The PRO polypeptide is useful for linking a bioactive molecule to a cell. The PRO polypeptide or an antibody against it is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is a thrombolytic agent, interferon, interleukin, erythropoietin, colony stimulating factor and other cytokines. The PRO polypeptide is useful for treating disease such as cancer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, amyotrophic lateral sclerosis; inflammatory disease e.g. asthma, and the conditions of the colorectal carcinoma; apoptosis related conditions e.g. AIDS, amyotrophic lateral sclerosis; inflammatory disease e.g. asthma, and the color of 
atherosclerosis; neurodegenerative disease e.g. Alzheimer's disease, Parkinson's disease; cardiovascular disease e.g. hypertension and myocardial ischaemia; kidney disease e.g. renal failure and glomerulonephritis; lung disease e.g. pulmonary hypertension, bronch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated PRO polypeptides e.g. PRO213, Proparation pharmaceuticals, diagnostics, biosensors and

cartilage disorders and immune deficiencies 459pp; English

The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking CC bloactive molecules to cells expressing PRO polypeptides, for modulating CC bloactive molecules or antagonists. The bloactive molecule maybe a CC toxin, radiolabel or antibody, and causes apoptosis or death of the cell. CC The PRO polypeptides are useful for treating immune disorders, diabettes or hyper- or hypo-insulinaemia, cardiac insufficiency, nervous system CC disorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene CC mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout canimals, for the generatic analysis of individuals with genetic disorders, and in gene therapy. The present sequence represents a probe used in the examples of the present invention. Note: The sequence data for this cat seqdata.uspto.gov/psipsDIDEntry.html

                                                                                                                                                                                                                                                                        The invention relates to a new isolated nucleic acid molecule comprises a compared with at least 80% identity to: (a) a nucleotide encoding any of 94 PRO polypeptides whose sequences are fully defined in the comparison of the full length coding sequences fully defined in the specification; or the full length coding sequences fully defined in the convergence of the propertide sequences. Also included are an isolated PRO polypeptide scoring at least 80% positives when compared to any of the PRO polypeptide sequences cited above (or an isolated PRO polypeptide having the least 80% amino acid sequence identity to: (a) an amino acid sequence composited with ATCC numbers listed in the competition or (c) an extracellular domain of the PRO polypeptide, with or cacid molecule, a host cell comprising the vector comprising the nucleic complexities; the sasociated signal peptide), a vector comprising the nucleic complexities and an anti-PRO antibody. The PRO polypeptide or polypeptide or polypeptide fuse are useful as pharasceuticals, conscriptions or biosensors or bioreactors. These are particularly useful for detecting or treating e.g. malignancies or canners (e.g. ovarian cancer, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, inflammatory disease, arthritis, immune-mediated alopecia, conversis, atherosclerosis, infertility, premature aging, psoriasis. The PRO polypeptides are useful in drug screening, psoriasis. The process of the presence of these diseases, and in the diagnostic contentiation of the presence of these diseases, and in the diagnostic contentification. The pro genes are useful as hybridisation probes, or for screening ilbraries of human cDNA, genomic DNA or RNA. The PRO genes may concern the present sequence is a TagMan PCR probe used in a Nortern blot experiment to detect PRO sequences in certain cancer cell lines.

                                                                                                                                                                                                                                                                                                               The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO1559 is useful for detecting PRO725, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO4993 polypeptide. PRO1559 is useful for linking a bioactive molecule to a cell expressing a PRO4993 polypeptide. PRO735, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739

                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO317, PRO1559, PRO7025, PRO700 or PRO719 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, and for identifying agonists or antagonists. The bioactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for

Novel secreted and tra encoding them, useful muscle generation and secreted and transmembrane polypeptides and polynucleotides ing them, useful for treating wound healing, tissue growth and egeneration and regeneration, amyotrophic lateral sclerosis o

Example 114; SEQ Ħ g 472pp; English.

The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO860 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ई
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC diabetic peripheral neuropathy. A polynucleotide (II) encoding (I) is CC useful for generating transgenic animals or knockout animals which are CC useful in the development and screening of therapeutically useful CC reagents, as probes for generating a pool of sequences for identifying CC related PRO coding sequences, and to construct hybridisation probes for CC mapping the gene which encodes the PRO and for the genetic analysis of CC individuals with genetic disorders, for recombinantly expressing (I) and CC protein electrophoresis purposes, and as therapeutic agents. (I) is a ccentral for screening compounds to identify those that mimic the PRO CC useful for screening compounds to identify those that mimic the PRO CC polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). (I) and (II) are useful for tissue typing. PRO antibodies are useful for rissue typing. PRO antibodies are useful for stassay of sample CC detecting its expression in specific cells, tissues or serum, and for CC affinity purification of PRO from recombinant cell culture or natural CC sources. This sequence represents a human seceretd and transmembrane PRO CC protein associated probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal mentioned above, a vector comprising a PRO nucleic acid, a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide signal polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                                                 New isolated secreted and transmembrane PRO polypeptides, useful in preparation of a medicament for treating a condition responsive to t polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                            Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ashkenazi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16-OCT-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10-APR-2003

                       The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acids (a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO37 polypeptide is useful for detecting PRO4993 polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting produce. PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for treating kidney diseases, bone, cartilage and retinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                      Example 114; SEQ ID NO 573; 468pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2003-657582/62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENENTECH INC.

                                                                                                                        The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                Novel isolated secreted and transmembrane PRO polypeptides, useful in preparation of a medicament for treating a condition responsive to the polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                     Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (GETH )

                                                                                                                                                 The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO200, PRO866, PRO703, PRO708, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO860 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or
                                                                                                                                                                                                                                                                                Novel isolated secreted and transmembrane PRO polypeptides, useful preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines.

```
Ct transmembrane protein) having at least 80% amino acid sequence dentity
Ct to an amino acid sequence chosen from 94 fully defined sequence as given
CC in the specification (including PRO lacking its associated signal
CC peptide). Also included are nucleic acids encoding the proteins
CC mentioned above, a vector comprising a PRO nucleic acid). A host cell
CC comprising the vector and producing PRO. a chimaeric molecule comprising
CC antibody. PRO337 polypeptide is useful for detecting a PRO493
CC polypeptide in a sample suspected of containing PRO493 polypeptide.
CC Similarly, PRO4939 polypeptide is useful for detecting a PRO493
CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO493
CC polypeptide, and PRO1559 polypeptide is useful for Inking a
CC profit or PRO739. PRO4939 polypeptide is useful for Inking a
CC profit or PRO739 polypeptide is useful for Inking a
CC molecule is the toxin, radiolabel, or an antibody. The bicactive molecule
CC causes death of the cell expressing PRO493 polypeptide;
CC molecule is the toxin, radiolabel, or an antibody. The bicactive molecule
CC useful for linking a bicactive molecule
CC useful for linking a bicactive molecule
CC useful for linking a bicactive molecule
CC useful expressing PRO1559 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO1359 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO337 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO337 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO337 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO337 polypeptide; and PRO1559 polypeptide is
CC useful expressing PRO337 polypeptide; and PRO1559 polypeptide;
CC polypeptide or anti-PRO493 polypeptide;
CC polypeptide or anti-PRO337 polypeptide is useful for modulating the
CC polypeptide;
CC polypeptide is useful for modulating the profit is
CC polypeptide;
CC polypeptide is useful for modulating the profit is
CC polypeptide;
CC polypeptide is useful for modulating the profit is 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ferrara

useful for rheumatoid New hypoinsulinemia or wounds. and its encoded secreted and transmembrane polypeptides, treating e.g. lung or breast tumors, osteoarthritis, arthritis, obesity, diabetes, hyperinsulinemia,

Example 114; SEQ ID NO 573; 452pp; English.

CC transembrane protein; having at least 80% amino acid sequence identity
CC to an amino acid sequence chosen from 94 fully defined sequences as given
CC in the specification (including PRO lacking its associated signal
CC peptide, a PRO extracellular domain with or without its associated signal
CC mentioned above, a vector comprising a PRO nucleic acid), a host cell
CC comprising the vector and producing PRO, a chimaeric molecule comprising
CC PRO fused to a heterologous amino acid sequence, and an anti-PRO
CC polypeptide in a sample suspected of containing PRO4993 polypeptide.
CC Similarly, PRO493 polypeptide is useful for detecting a PRO4993
CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337
CC polypeptide, and PRO1559 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting PRO1559.
CC pro7055, PRO700 or PRO739. PRO4993 polypeptide is useful for inking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a CC pro700 or PRO739 polypeptide are useful for linking a bioactive molecule for a cell expressing PRO493 polypeptide; and PRO1559 polypeptide; and PRO1559 polypeptide is useful for linking a cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for linking a cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for linking a cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for linking a polypeptide; and PRO337
CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO339 polypeptide; PRO337
CC polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO339 polypeptide; PRO337 The invention relates to an isolated PRO polypeptide (secreted or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PRO700 or PRO739 polypeptide or an anti-PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO700 or PRO739 polypeptide. The polypeptides are useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, osteoarthitis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence is a Tagman PCR probe used investigate PRO gene amplification in certain tumour cell lines.

Goddard Kljavin New secreted and transmembrane PRO nucleic acids and polypeptides, useful for stimulating the release of tumor necrosis factor alpha from human blood and stimulating the proliferation of differentiation of chondrocyte WPI; Ferrara 2003-852598/79 Į, », TA, Godowski PJ Kuo SS, N Filvaroff E, Tumas KP, Botstein D, Desnoyers L, Eaton DL; E, Fong S, Gao W, Gerber H, Gerritse PJ, Grimaldi JC, Gurney AL, Hillan KJ; Napier MA, Pan J, Paoni NF, Roy MA, Williams PM, Wood WI; Eaton DL; Gerritsen ME; Shelton 멅

Example 114; SEQ ID NO 573; 462pp; English

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequences as given to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide in a sample suspected of containing PRO493 polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting

ភពៈភិពិសិក្សិក ស្ត្រិក PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking s in þ

Also included are nucleic acids encoding the proteins of peptide, a PRO extracellular domain with or without its associated signal comparising in comprising PRO nucleic acids encoding the PRO proteins peptide). Also included are nucleic acids encoding the PRO proteins comprising PRO antibody. PRO337 polypeptide is useful for detecting a PRO extracellular comprising PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO325. PRO700 or PRO739. PRO4933 polypeptide is useful for detecting PRO325. PRO700 or PRO739. PRO4933 polypeptide is useful for inking a bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule coa cell expressing PRO4933 polypeptide. The bioactive molecule coacell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337. PRO4933 polypeptide is useful for molecule coacell expressing PRO337 polypeptide is useful for molecule pro337 polypeptide. PRO337 polypeptide is useful for molecule pro337 polypeptide is useful for molecule pro337 polypeptide is useful for molecule pro337 polypeptide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO359 polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting PRO725, PRO700 or PRO739.
                                                                                                                                                                                         Human; 88; PCR; secreted protein; transmembrane protein; PRO; cytostati ophthalmological; antiarthritic; osteopathic; antireleumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; probe; in situ hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide, a PRO extracellular domain with or without its associated signal

```
CC to an amino acid sequence chosen from 94 fully defined sequences as given CC in the specification (including PRO lacking its associated signal CC peptide), a PRO extracellular domain with or without its associated signal CC peptide). Also included are nucleic acids encoding the pRO proteins CC mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO CC polypeptide in a sample suspected of containing PRO4993 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting a PRO4993 CC polypeptide, PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 CC polypeptide, PRO700 or PRO739. PRO700 or PRO339 polypeptide is useful for cletcting PRO725, PRO700 or PRO739. PRO700 or PRO339 polypeptide is useful for linking a contactive molecule to a cell expressing PRO337 polypeptide is useful for linking a contactive molecule to a cell expressing PRO337 polypeptide; and PRO359 polypeptide; PRO725, PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO4933 polypeptide; and PRO1559 polypeptide is useful for linking a contactive molecule to a cell expressing PRO4933 polypeptide; and PRO1559 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; and PRO1559 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO3725, CC polypeptide; pRO337 polypeptide, pRO4933 polypeptide is useful for modulating the pro735, and PRO739 polypeptide or anti-PRO375, cc polypeptide; and PRO1559 polypeptide; pRO725, cc polypeptide; and PRO359 polypeptide; pRO725, cc polypeptide; and PRO359 polypeptide; pRO739 polypeptide; pRO739 polypeptide; pRO739 polypeptide; pRO739 polypeptide; pRO739 polypeptide; pRO739 polypeptide; pRO3700 or anti-PRO39 polypeptide; pRO337 polypeptide; pRO337 polypeptide; pRO339 polypeptide; pRO339 polypeptide; pRO339 polypepti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-APR-1999;

                                                                                                                                                                                                                                                                        The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence as given to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated PRO polypeptide e.g. PRO200, PRO322, PRO540, PRO846 or PRO617 polypeptide, useful for treating sight loss due to retinitis pigmentosum by enhancing retinal neural cells survival.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993
                                                                                                                                                                                                                                                         New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO4993 PRO337, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 (CC "polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4993 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO735 polypeptide or a cell expressing PRO735, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 cc polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide, where the cell is killed. PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 cc pro700 or PRO739 polypeptide or an anti-PRO4993 polypeptide; PRO725, polypeptide; and PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 cc polypeptide; and PRO1559 polypeptide or anti-PRO75, anti-PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti-PRO700 or anti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S

Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO 1 seed to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting PRO493 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; 88; PCR; secreted protein; transmembrane protein; PRO; cytostatic ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; probe; in situ hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US2003198994-A1.
